

The chart illustrates the historical shift in global fertility patterns. The initial high peak in the 1960s corresponds to a period of rapid population growth. The subsequent decline and the smaller peak in the 1980s reflect the beginning of the demographic transition. The low fertility levels from 2000 to 2020 indicate that most women are now having fewer than two children on average, which is a key factor in slowing global population growth.
